

Evaluation of the product:

- The user will be able to add an item, and give details about the item including:
 - Item name
 - Price
 - Description
 - Amount
 - If the item has been sold
- The user will also be able to list off all of their items, and be able to delete items
- The user can export the list of their items to be viewed in a spreadsheet program(Google Sheets or Microsoft Excel)
- The user will be able to sort through the items to easily find them

The project met all of the success criteria. While I did not get a chance to get to any of my client's "wishlist" items, it should be considered a success. My client did have a couple of suggestions, which I will take into account

Recommendations for future development/improving the product:

My client's recommendations range from small-scale to large-scale. Starting at the least complex, he recommended that I:

- Remove the "Title" column in the table - I had forgotten it was even there
- Make a button to easily copy the item name
- Change where the window pops up - I had accidentally made it dependent on monitor size
- Get rid of the "Close" button because it doesn't do much
- Make the data more easily exportable to Excel or Sheets
- Have the user able to add pictures for the items - (I have no idea how to do this)
